Abstract- This research study explores the psychosocial impact of cyberspace violence on children. The current research has been laid through case study method. In order to investigate, the sample was drawn from 30 children reported by different city for experiencing conduct problems and inadequate academic performance. During therapeutic probing, this was revealed that they had been exposed to the cyberspace violence in one form or the other and which has caused them vulnerable to various psychosocial complexities. The detailed case studies of each of the child were obtained along with the detailed interview sessions with the parents and their respective teachers. The revealed findings indicate the various conduct problems experienced by the children. The reported intricacies of the conduct problems were also outlined with the help of conduct problems checklists, the furnished the absolute findings. The type of the exposed violence was correlated with the impact of the harm done to the child and also with the frequency and the number of the behavior problems exhibited by the child. The findings clearly reveal the gravity of the scenario. With the advancement of technologies, the children are being exposed to exponentially greater harm. The implication of the findings have been discussed with reference to the counseling and management practices for the family and the child.

Keywords- psychosocial problems cyberspace violence children counseling
